```
library(sf)
library(spdep)
library(tmap)

NC <- read_sf("data/NC_REGION.shp")

NC_UTM <- st_transform(NC, crs = st_crs("EPSG:26917"))</pre>
```

#### Question 1:

Use the poly2nb() function to create a Rook's case neighbor construct by changing queen = TRUE to queen = FALSE. Call this new object rook\_nb in your code. Plot a map using tmap that shows the counties, the connections as lines, and the county centroids as points. Include a title (hint: use main.title if you want to have the title outside the map frame).

```
rook_nb <- poly2nb(NC_UTM, queen = FALSE)

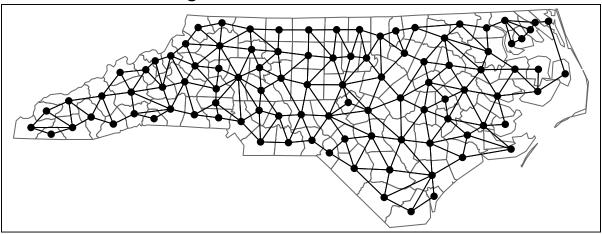

NC_centroids <- st_centroid(NC_UTM)

## Warning in st_centroid.sf(NC_UTM): st_centroid assumes attributes are constant over geometries of x

nb_lines <- nb2lines(
    nb = rook_nb,
    coords = NC_centroids$geometry
)

tm_shape(NC_UTM) +
    tm_borders() +
    tm_borders() +
    tm_shape(NC_centroids) + tm_lines() +
    tm_shape(NC_centroids) + tm_dots(size = 0.2) +
    tm_layout(
        main.title = "Rook's Case Neighbors"
)</pre>
```

# Rook's Case Neighbors

### Question 2:

Compare the distribution of links between the Queen's case and Rook's case. What changed when we restricted the neighbor criterion by using a Rook's case? Using the code above, what are **names** of the 'least connected regions' generated with a Rook's case neighborhood? Provide the code used to get your results.

```
queen_names <- NC_UTM %>%
  tibble::column_to_rownames("NAME") %>%
  st_as_sf() %>%
  poly2nb(
    pl = .,
    queen = TRUE
  )
summary(queen_names)
```

```
## Neighbour list object:
## Number of regions: 100
## Number of nonzero links: 490
## Percentage nonzero weights: 4.9
## Average number of links: 4.9
## Link number distribution:
##
## 2 3 4 5 6 7 8 9
## 8 15 17 23 19 14 2 2
## 8 least connected regions:
## Currituck Chowan Tyrrell Dare Polk Pamlico Clay New Hanover with 2 links
```

```
## 2 most connected regions:
## Iredell Moore with 9 links
rook_names <- NC_UTM %>%
  tibble::column_to_rownames("NAME") %>%
  st_as_sf() %>%
  poly2nb(queen = FALSE)
summary(rook names)
## Neighbour list object:
## Number of regions: 100
## Number of nonzero links: 462
## Percentage nonzero weights: 4.62
## Average number of links: 4.62
## Link number distribution:
##
## 2 3 4 5 6 7 8 9
## 8 18 20 25 21 4 3 1
## 8 least connected regions:
## Currituck Chowan Tyrrell Dare Polk Pamlico Clay New Hanover with 2 links
## 1 most connected region:
## Iredell with 9 links
```

#### Question 3:

In addition to k = 1, use knn2nb() to create neighbor constructs for k = 2, k = 4, and k = 6. Plot the connections for each using tmap, including the label (e.g., "k = 1"). Provide your R code and plots for the neighbor constructs. Use tmap\_arrange() to place all 4 plots in a single "image".

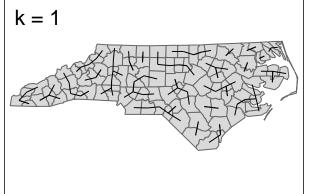

"Extra credit" if students can do this in a for loop, using lapply, purrr::map, etc., i.e., not doing it "one at a time"

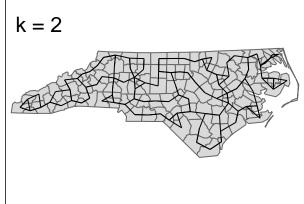

```
k_1 \leftarrow knn2nb(
  knn = knearneigh(
    x = NC_centroids,
    k = 1
  ),
  row.names = NC_UTM$NAME
) %>% nb2lines(coords = NC_centroids$geometry)
k_2 \leftarrow knn2nb(
  knn = knearneigh(
    x = NC_centroids,
    k = 2
  ),
  row.names = NC_UTM$NAME
) %>% nb2lines(coords = NC_centroids$geometry)
k_4 \leftarrow knn2nb(
  knn = knearneigh(
    x = NC_centroids,
    k = 4
  ),
  row.names = NC UTM$NAME
) %>% nb2lines(coords = NC_centroids$geometry)
```

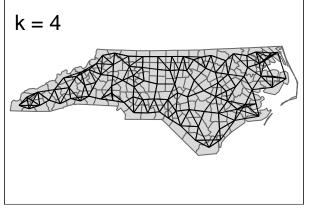

```
k_6 <- knn2nb(
knn = knearneigh(
    x = NC_centroids,
    k = 6
),
    row.names = NC_UTM$NAME
) %>% nb2lines(coords = NC_centroids$geometry)

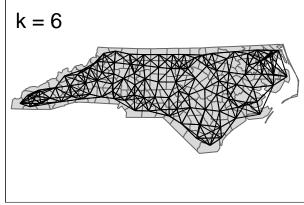

t1 <- qtm(NC_UTM) + qtm(k_1, title = "k = 1")
t2 <- qtm(NC_UTM) + qtm(k_2, title = "k = 2")
t4 <- qtm(NC_UTM) + qtm(k_4, title = "k = 4")
t6 <- qtm(NC_UTM) + qtm(k_6, title = "k = 6")

tmap_arrange(
    t1, t2,
    t4, t6,
    nrow = 2
)</pre>
```

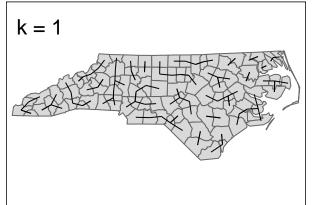

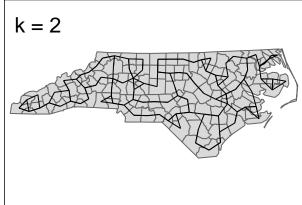

```
### Extra credit:)
# This part is super open-ended and meant to develop problem-solving skills with
# R. I'm a huge fan of purrr, so it's what I used to make these:)
ks <- c(1, 2, 4, 6)</pre>
```

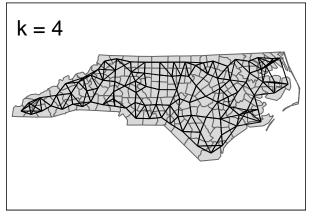

```
plot_knn <- function(k) {
  knn <- knn2nb(
    knn = knearneigh(
    x = NC_centroids,
    k = k
    ),
    row.names = NC_UTM$NAME
)
  knn_sf <- knn %>% nb2lines(coords = NC_centroids$geometry)

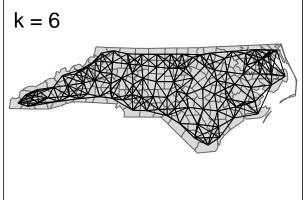

qtm(NC_UTM) + qtm(knn_sf, title = paste("k =", k))
}

ks %>%
  purrr::map(plot_knn) %>%
  tmap_arrange()
```

## Question 4:

- a. In addition to our "100%" distance threshold (the code above), create plots for:
- 50% of the maximum distance,
- 125% of the maximum distance,
- 150% of the maximum distance.

- b. Use tmap to do this, and arrange all plots in a single image using tmap\_arrange(). Be sure to label each plot.
- c. What happened to the number of connections from the 75% to the 125% construct?

```
NC_knn1 <- knn2nb(</pre>
  knn = knearneigh(x = NC_centroids,
                    k = 1),
  row.names = NC_UTM$NAME
dist <- nbdists(</pre>
  nb = NC_knn1,
  coords = NC_centroids$geometry
) %>%
  unlist()
max_dist <- max(dist)</pre>
ds \leftarrow c(0.75, 1.00, 1.25, 1.50)
plot_dnn <- function(d) {</pre>
  d_threshold <- d * max_dist</pre>
  dnn <- dnearneigh(</pre>
    x = NC_centroids,
    d1 = 0,
    d2 = d_threshold,
    row.names = NC_UTM$NAME
  dnn_sf <- dnn %>% nb2lines(coords = NC_centroids$geometry)
  qtm(NC_UTM) + qtm(dnn_sf, title = paste0("d = ", as.character(d * 100), "%"))
}
  purrr::map(plot_dnn) %>%
  tmap_arrange(nrow = 2)
```
